

One logo, every slide

A foreground passed to setup is painted over every slide in the deck.

It does not move

The `place()` alignment resolves against the slide rather than the content, so the logo lands in the same spot however full the slide is.

Refining the position

`dx` and `dy` nudge it away from the edge. Em units keep that inset proportional to the deck's type size.

Hiding it

One slide opts out with foreground: none.
